

< Diagnosing bias and variance >

$$f_{\vec{w},b}(x) = w_1 x + b \quad d=1$$

"High bias"
(underfit)

$d=1$ \Downarrow
(J_{train} is high)
(J_{cv} is high)

$$f_{\vec{w},b}(x) = w_1 x + w_2 x^2 + b \quad d=2$$

"Just right"

$d=2$ \Downarrow
(J_{train} is low)
(J_{cv} is low)

$$f_{\vec{w},b}(x) = w_1 x + w_2 x^2 + w_3 x^3 + w_4 x^4 + b \quad d=4$$

"High variance"
(overfit)

$d=4$ \Downarrow
(J_{train} is low)
(J_{cv} is high)

* Polynomial order d 에 대한 J_{cv} 와 J_{train} 의 상관관계

\Downarrow
"Diagnosing bias or variance problem"

- ① High bias (underfit) : J_{train} will be high ($J_{\text{train}} \approx J_{\text{cv}}$)
- ② High variance (overfit) : $J_{\text{cv}} \gg J_{\text{train}}$ (J_{train} may be low)
- ③ High bias and High variance (simultaneous) : J_{train} will be high $\oplus J_{\text{cv}} \gg J_{\text{train}}$
